

Medicom Innovation Partner is looking for a Test Engineer who has a passionate interest for being a part of a project organization creating unique products for people who need medical treatment.

About the position:

It is your responsibility to test products and components to ensure the applicable specifications are met. This includes specification, development and documentation of new test methods and processes to match the requirements from the projects.

Based on experience and statistical calculation you are responsible for input to the projects concerning specification of test, test equipment and number of samples.

In our well-equipped test-lab you either carry out the test yourself or you give guidance and support to the project engineers. Test results in general and specific statistical material are the basis for your analysis and feedback to the projects.

Maintenance, usability and continuous improvement of test, test setups, methods and equipments including calibration and nonconformities reporting is a part of your job.

What we are looking for in you:

Professional qualifications

Master or Bachelor degree in Mechatronics / Mechanical / Electronic Engineering or similar qualifications.

Personal qualifications

You are analytical and theoretical well-grounded. You have a systematic approach to your work and you deliver well-structured results. You love to use your engineering skills solving complex problems and you understand the importance of appropriate high quality and documentation.

You are proactive, result oriented and a self-motivated team player who takes responsibility for own work and deliveries.

You have excellent written and verbal communication skills and you are fluent in written and spoken English.

We offer you

- A challenging position in an international innovative and successful company in growth
- An opportunity to become part of a team of dedicated and highly qualified test colleagues based in Struer, Denmark.
- Cooperation in cross-functional project teams with great opportunities to influence the daily work
- Well-structured training and continuous development of your competencies including the area of Medical Device and the development process in a regulated world.
- Participation in test competence projects and tasks
- Exciting career possibilities within the constantly growing area of medical devices

The Company – in short
